Appl. No. TBD
Preliminary Amdt. Dated September 29, 2005
Reply to Office action of N/A

Amendments to the Claims:

This listing of claims will replace all prior versions, and listings, of claims in the application:

Listing of Claims:

13

contact.

- 1 Claim 1 (original): A moving device comprising: 2 object detecting means for detecting a contact of an 3 object, a moving body on which the object detecting means is 4 5 provided, driving means for driving the moving body and control 6 means for controlling the driving means, 7 wherein the control means stops the movement of the 9 moving body or controls the driving means in such a manner 10 as to reverse the moving direction of the moving body when the object detecting means detects a contact of an object 11 12 or detects a removal of the object that has been in
- Claim 2 (original): A moving device as set forth in
 Claim 1, wherein the object detecting means comprises a
 flexible piezoelectric sensor and a detecting portion for
 detecting a contact or removal of an object based on an
 output signal of the piezoelectric sensor.
- 1 Claim 3 (original): A moving device as set forth in

7

1

2

3

4

5

6

1

- 2 Claim 2, wherein the detecting portion determines that
- 3 either a contact or removal of an object occurs when the
- 4 amplitude of an output signal of the piezoelectric sensor
- 5 overpasses a set range which is set in advance.

shutters of elevators and buildings.

- 1 Claim 4 (currently amended): A moving device as set
 2 forth in any of claim 1 to 3Claim 1, wherein the moving
 3 body is at least one of such openable and closable doors as
 4 automotive sliding door, tailgate, trunk lid, window of a
 5 type that can ascend and descend and sunroof, openable and
 6 closable wings on a cargo deck of a truck, and doors and
- 1 Claim 5 (currently amended): A moving device as set
 2 forth in any of claims 1 to 3Claim 1, wherein the moving
 3 body is a running vehicle having a bumper, and wherein the
 4 object detecting means is provided on the bumper.
 - Claim 6 (currently amended): A moving device as set forth in any of claims 1 to 5Claim 1, wherein information means is provided which informs that the driving means is to stop the movement of the moving body or reverse the moving direction of the moving body, when the object detecting means detects a contact or removal of an object.
 - Claim 7 (original): A moving body opening and closing

- 2 control system comprising:
- a moving body that is constructed to be opened and
- 4 closed freely,
- 5 a sensor that is attached to the moving body for
- 6 detecting vibrations generated by a contact of an object or
- 7 catching of an object and
- 8 a control unit for controlling opening and closing
- 9 operations of the moving body based on an output signal
- 10 from the sensor,
- wherein the control unit starts an energization to the
- 12 sensor at least with an opening operation of the moving
- 13 body, and
- 14 wherein when a contact of an object is detected by the
- sensor during a closing operation, the closing operation of
- the moving body is stopped or the moving body is opened.
- 1 Claim 8 (original): A moving body opening and closing
- 2 control system as set forth in Claim 7, wherein a
- 3 piezoelectric sensor which is flexible and which takes the
- 4 form of a cable is used as the sensor.
- 1 Claim 9 (original): A moving body opening and closing
- 2 control system as set forth in Claim 7, wherein when the
- 3 sensor detects vibrations or catching in the middle of an
- 4 opening operation of the moving body, the movement of the
- 5 moving body is stopped or the moving body is closed.

- Claim 10 (original): A moving body opening and closing control system as set forth in Claim 7, wherein the energization to the sensor is continued while the moving body is in an opened state.
- 1 Claim 11 (original): A moving body opening and 2 closing control system comprising a moving body that is 3 constructed to be opened and closed freely, a sensor that is attached at a fixing portion that is opposite to the 4 5 moving body for detecting a catching caused by the moving body and a control unit for controlling the moving body and 6 7 the sensor, wherein the control unit starts an energization 8 to the sensor at least with an opening operation of the 9 moving body.
- Claim 12 (original): A moving body opening and closing control system as set forth in Claim 11, wherein a piezoelectric sensor which is flexible and which takes the form of a cable is used as the sensor.
- Claim 13 (original): A moving body opening and closing control system as set forth in Claim 11, wherein the energization to the sensor is continued while the moving body is in an opened state.

16

Claim 14 (original): A moving body opening and 1 closing control system comprising: 2 a moving body that is constructed to be opened and 3 4 closed freely, 5 a sensor that is attached to the moving body for 6 detecting vibrations generated by a contact of an object or catching of an object and 7 8 a control unit for controlling the moving body and the 9 sensor, 10 wherein the control unit has a function to detect an instantaneous disconnection of a power supply, discontinues 11 the movement of the moving body or reduces the speed 12 13 thereof when the instantaneous disconnection of the power supply is detected and causes the moving body to normally 14 15 operate after the power supply is restored

predetermined time has been counted since then.
